The app's purpose is to serve as a virtual queue for the citizens in hospitals. The Virtual Medical Queue System's goal is to help citizens avoid standing and waiting in long queues and have a way to easily queue up for check-ups and initial screenings using just their web browser from their phone. I made the layout to be as user friendly as possible to make sure anyone is able to use it intuitively, while also making use of my branding's color palette to keep the professional and calm look. A challenge I faced while making this app is recognizing that there are many patients with varying needs and a simple app like this would likely not be enough. With more time, I could improve more on the UI of the app, as well as provide more features that can cater to more specific needs like emergencies, as well as the user flows for those to demonstrate it.
